Box No. IV Text of the abstract (Continuation of item 5 of the first sheet)

An injection device (110) comprises a locking mechanism (170) between a syringe carrier (127) and a drive mechanism (129) of the injection device. The drive is formed in such a way to inhibit movement of the syringe carrier (127) and syringe (114) held by the syringe carrier (127) towards an exit aperture (128) of the injection device when the drive is not itself being forced into a direction towards the exit aperture. This assists in preventing damage to the syringe prior to actuation of the injection device.
